I have a friend at the Indian Institute for Defense Studies and Analysis, who I've known for years. He wrote asking if I would write a short piece for this journal.

I looked up the journal and ran across this interesting article written by an Israeli named Dany Shoham . Former Israeli Intel guy who apparently now writes for the Wash Post.

<https://idsa.in/cbwmagazine/chinas-biological-warfare-programme>

An older one generally on the same topic, also by Dany Shoham from 2015; also an Indian journal

This article may be used for research, teaching and private study purposes. Any substantial or systematic reproduction, re-distribution, re-selling, loan or sub-licensing, systematic supply or distribution in any form to anyone is expressly forbidden.

Views expressed are those of the author(s) and do not necessarily reflect the views of the IDSA or of the Government of India.

world's largest deoxyribonucleic acid (DNA) sequencing installations.¹ The DNA sequencing might refer to any organism, be it man, a germ or a virus, either for analysing its full genome or specific parts of the genome that are responsible for certain properties.

It so happens that this paramount prediction made by the Monitor Group is currently being realized by China. The range and magnitude of consequences and implications are vast, including military-oriented ones. Among the latter is the sphere of biological warfare agents (BWA), with the obvious option of being upgraded by genetic engineering techniques on the one hand, and the tentative option of modifying certain BWA (in theory, at the least) so as to increase their impact against particular ethnic groups, on the other hand. Chinese scientists, and resultantly strategists, are most probably aware of those two options; and while it is clear, according to the present study, that they are actually implementing the first option of the two, the excludability of the second option appears to be uncertain.

Fundamentally, it is assumed that China would not miss, skip, or give up any highly advanced technology, especially when it is military-oriented. This postulation refers to BW, among other disciplines. And it seems that once targeted, the upgrading of BW by Chinese military scientists will persist for long. This article discusses the various factors shaping Beijing's attitude to BW, and covers dozens of non-civilian facilities in China having the capacities, at the least, to be involved in research, development, testing and production of BW.

HISTORICAL AND GEOSTRATEGIC FACTORS

A combination of past and present geostrategic factors distinctly affect the Chinese approaches and outlooks with regard to BW. The first major factor is the relapsing Japanese BW attacks against and human BW experimenting on Chinese populations, which took place from 1933 to 1945, killing and injuring tens of thousands, without the Chinese being able to cope or retaliate. The employment of BW against the Chinese by the Japanese military had a long-lasting impact in China. The Chinese official news agency, *Xinhua*, reported in 2002, that 'at least 270,000 Chinese soldiers and civilians were slaughtered by Japanese germ-warfare troops between 1933 and 1945', according to an 'in-depth study by Chinese and Japanese scholars.'²

The second factor is the Chinese belief (whether sound or unsound) that the United States (US) conducted BW offensive operations in China

The Galveston National Laboratory is one of two university-based maximum containment laboratories in the U.S. focused on the study of highly infectious diseases and the development of medical countermeasures. The GNL and UTMB have one of the country's most active programs to safely and securely study emerging and re-emerging high consequence pathogens and collaborate with scientists around the world. The lab is part of NIAID's Biodefense Laboratory Network, and as part of its mission assists the U.S. in the event of a national emergency. Currently the lab is focused on diagnostic, and vaccine development for COVID-19, as well as testing of existing and new antiviral and antibody therapies.

According to Dr. James Le Duc, Director of the Galveston National Lab, "As a university-based lab, training the next generation of scientists to work safely and securely in high containment facilities to study dangerous pathogens and conduct pre-clinical studies is a major mission.

Through our Biosafety Training Center, UTMB has provided laboratory safety and security training for scientists and operations personnel in more than 70 countries. The relationship with Wuhan Institute of Virology and the GNL dates back to 2013 and has been facilitated through an ongoing dialogue co-sponsored by the Chinese Academies of Science and National Academies of Science, Engineering and Medicine with cooperation from the Chinese CDC and others.

Thanks Zhiming. You are in a very challenging position and doing a great job. I would however recommend that you organize and quickly implement a way to share reference isolates. With cases occurring outside China, others will soon have their own isolates and China will have lost the opportunity for leadership. And if scientific publications start appearing from Chinese investigators without the world having independent access to a strain, China will likely be heavily criticized.

Keep up the good work

Jim

Mifang, please see Op Ed pasted below that was sent today to the Houston Chronicle. I don't know if they will accept it, but I hope they do. I tried to stress the positive impact of the Chinese investments in public health and laboratory capacity that has been made since SARS. Please let me know if you see anything in the article that is in error. I am a little concerned about the highlighted sentence below since I don't have specific examples to note if asked. Can you provide any? Closing the market is one I presume.

We obviously would like to receive a reference strain for study here. Please let me know if there is a way to get an isolate. We would welcome someone from China CDC to collaborate with our folks here on testing if you like.

Best wishes,

Jim

Chinese Response to New Virus Shows Promise

By James W. Le Duc

Fast action and open communications by China may be saving the world from another devastating infectious disease outbreak. Many will recall the dark days in the spring of 2003 when Asia and the world were threatened by the appearance of a new virus disease, Severe Acute Respiratory Syndrome, or SARS, which first appeared in southern China and quickly spread to other countries around the world, ultimately causing over 8000 cases with nearly 10% of those ending in death.

SARS was caused by a novel coronavirus then unknown to medical science. There was no known cure, no diagnostic tests and little understanding of where it came from or how it was spread, although person-to-person transmission was obvious as health care workers treating the first cases were themselves among the early victims. Initially, China was reluctant to share information or alert the international community of the magnitude of the epidemic, leading to international criticism and a dangerous global health situation. Fortunately, under pressure, China reversed its position, opened its borders to collaborations with the WHO, U.S. and others, and the epidemic was eventually controlled.

Today, another novel coronavirus has been discovered, again in China; however, this time, less than two decades later, things are very different. Chinese health officials recognized that a new disease had emerged, quickly isolated the patients, and instituted an impressive set of interventions to limit the spread of disease and characterize the new pathogen. Importantly, they have been transparent in sharing their findings with the world, thus allowing other nations to be on the lookout for the new disease. The genome of the new virus was completely sequenced and posted for easy access by international experts, allowing rapid exploration of possible treatments, development of diagnostics and epidemiological investigations.

The outbreak is still in the early stages and fortunately, preliminary results suggest that the new virus may not be easily transmitted from person-to-person. While only about 40 patients have been identified, there has been at least two deaths and spread of infected persons from the epicenter in Wuhan to Thailand and Japan. Our CDC is initiating screening at select U.S. airports of travelers arriving from Wuhan.

China's ability to respond quickly and efficiently to this new threat is the result of nearly two decades of investments and collaborations to improve public health in China. The Chinese Centers for Disease Control incorporates many of the strengths of our own CDC, but is designed to meet the needs of a 1.4 billion plus population. In addition, China has invested in building a robust scientific capacity and partnered with containment laboratories such as ours to incorporate best practices when studying dangerous pathogens.

The current outbreak clearly demonstrates a new openness to health information sharing with the global community. To diagnose an outbreak early requires astute healthcare providers able to recognize when something new or unusual is occurring; however, clinical recognition alone is meaningless if there is no capacity to investigate the cases or characterize the disease-causing agent.

For the last few years, the D.C.-based National Academy of Science, Engineering and Medicine has worked with the Chinese Academy of Sciences to build relationships and share information on emerging diseases and advancements in the development of vaccines and treatments. In Galveston, we have welcomed leading Chinese health officials to learn about biocontainment facility design and construction, biosafety training and laboratory operations. These collaborations, along with U.S.-based educational opportunities for Chinese students, benefit us all.

China's response to the new coronavirus clearly demonstrates that their investments both in physical laboratories and scientific diplomacy over the past decade are paying dividends, not only to China, but the entire world. Since infectious diseases do not recognize international borders, much must still be done with this current and quickly evolving situation, including the sharing of

Subject: Suggestions

Dear Zhiming,

I am devastated to see the evolving nCoV epidemic unfolding in Wuhan and I just hope that you, your family and the larger Institute colleagues are well and surviving this very difficult time.

I want to suggest that you conduct a thorough review of the laboratory activities associated with research on coronaviruses so that you are fully prepared to answer questions dealing with the origin of the virus. I'm sure that you have considered this already, but attached are some areas where you may wish to investigate and be prepared to address. You might even consider preparing a manuscript that addresses these topics in an effort to be transparent and proactive. I would be pleased to work with you on such a paper if you think that would be helpful.

I raise these issues since I am receiving questions along these lines more and more frequently. Initially they came from social media and other "alternate information sources" but in the last few days I have been approached by senior officials and major reputable newspapers. Most link the opening of the new BSL4 lab as a possible source of the virus. Clearly addressing this will be essential, with any kind of documentation you might have available used to back up your comments. (It's not clear to me where the coronavirus work was/is actually being conducted.)

I have the utmost respect and admiration for Dr Shi and I am in no way casting doubt on her or her colleagues. I just think that we need to aggressively address these rumors and presumably false accusations quickly and provide definitive, honest information to counter misinformation. If there are weaknesses in your program, now is the time to admit them and get them corrected.

I trust that you will take my suggestions in the spirit of one friend trying to help another during a very difficult time.

Jim

James W. Le Duc, Ph.D.

(t) 409-266-6500
(f) 409-266-6810
(m) 409-789-2012

Investigation into the possibility that the nCoV was the result of a release from the Wuhan Institute of Virology (main campus or new BSL3/BSL4 facilities).

The questions below deal with the period 1 October 2019 to the present:

Where is coronavirus research conducted?

What level of biocontainment?

How many different laboratories actually handle live virus?

Where are coronavirus stocks stored?

Is there an inventory record of each isolate of each coronavirus kept? If so, are there any discrepancies between the record and actual current inventory number (i.e., is there evidence to suggest that virus stocks may have been stolen or used without proper record?)

Physical Security

Is there controlled access to the laboratories and freezers where coronavirus stocks are held? (Locked doors; card-key access; biometric readers; others?) Were any breaches in security noted/access to the facility by unauthorized individuals?

Is the laboratory constantly monitored by security personnel (24/7)? If not, you could briefly summarize your physical security program during the period in question.

Is there any evidence to suggest a mechanical failure in biocontainment during the time in question?

- were biological safety cabinets used and appropriately certified?
- Exhaust air filtration systems working correctly?
- Autoclaves and waste stream disinfection systems working properly?
- Animal husbandry and management?
- Waste stream integrity (think of FMD leak in UK a few years ago)

Virus Stocks (You may wish to explain that many novel coronaviruses are known only from their sequence and are not able to replicate in culture)

When was the nCoV first handled in your laboratory?

What was the source of that virus? (patient specimen or field collected animal or other?)

During the period in question, what other coronaviruses (that replicate in culture) are stored/handled in your laboratories?

What are the coronaviruses in your possession that are most closely related to nCoV based on genetic sequences and are able to replicate in culture?

Is anyone on your team conducting gain of function studies, recombination studies or any other studies that may have resulted in the creation of the nCoV?

Personnel

How many people have access to the coronavirus stocks and laboratory?

Senior investigators? Junior investigators? Technical support staff? Post-docs? Students? Animal handlers? Janitors and other cleaning staff? Building support personnel? Others?

Is there any evidence to suggest that a disgruntled employee may have had access to the coronavirus stocks? (Recently fired or reprimanded individual(s), for example.)

Does the Institute have an occupational health clinic where employees and students can go to seek medical care? If so, was there any indication of unusual illness similar to that seen for nCoV among Institute staff? If yes, when were cases first seen relative to the nCoV outbreak.

Does a serum bank exist for staff and students working on infectious agents? If yes, could a current serum and the most recent banked sera be serologically tested for antibody to nCoV in an effort to document seroconversion? (If positive, this would not be able to differentiate between community acquired and occupational acquired infection, but absence of evidence of infection would be helpful in ruling out the lab as a source of infection.)

Have any of individuals working at the Wuhan Institute of Virology (main campus or BSL4 campus) been infected with the nCoV? Family members of employees?

If yes, when was the date of onset of illness for the first case recognized? (How does this date compare with the progress of the epidemic; that is, was this among the first cases recognized or later after the outbreak was well underway? How does this compare to the first recognition of nCoV in the greater Wuhan community?)

Where the individuals infected involved in coronavirus research?

Geography

(These questions deal with any association between the physical location of the lab(s) and the districts in Wuhan where the illness was first seen. The assumption is that someone suffering an occupational exposure would go to their local hospital for treatment.)

Where and when were the first Wuhan (or Hubei Province) residents infected with the nCoV first identified (hospital or clinic name/date of earliest cases)?

Do staff members of the Institute reside in the district serviced by this (these) hospital/clinic (s)?

Were any Institute staff members seen for clinical illness at this/these hospital (s) during the time in question?

Any thoughts on my question below. I am fine with letter as is, but does Iswem like situation has evolved a bit but still crucial to encourage Chinese to share isolates.

<peggy@hbfam.net> wrote:

Hello. I think it is a strong letter. However, has the argument shifted somewhat? Given that cases are occurring in many places now the opportunity to gather isolates does not depend on Chinese, however the ability to get full understanding of the virus and it's evolution would be greatly advanced by expanded sharing of isolates.

Subject: RE: COVID-19 origins

Hi Jim,

Can you clarify what goal you have in mind? Is it to have NASEM provide what we learned from the meetings to teams that are investigating the origins? Doing that would be out of the ordinary, but we could talk about whether there are conditions under which we could do it.

As for something public, NASEM would likely stay away from this, but if they did weigh in then my guess is that they would probably agree with Baric and Relman who now say publicly that "more investigation is still needed to determine the origin of the pandemic. Theories of accidental release from a lab and zoonotic spillover both remain viable."

We generally do not publicize or publish out of the dialogues. We have, in some cases, conducted projects that are joint workshops or studies intended and agreed from the beginning to have a public product.

We have provided and can provide again summaries of all our discussions to people within the U.S. government. As Peggy noted, the people and institutions involved did not agree to make the contents of the discussions public as an outcome when we developed agendas and held the discussions.

As for what we have made public...we were concerned last year that the lack of any public description of the China bio dialogue was creating problems, suggesting that we were not forthright about our work in the context of a witch hunt and leaving UTMB and you in particular in an awkward position, having nothing on our website to which you could refer reporters. We developed a description of the engagements, we posted that description on the web here <https://www.nationalacademies.org/our-work/us-china-bilateral-dialogue-on-the-challenges-of-emerging-infections-laboratory-safety-and-global-health-security>, and we gave short briefings to OSTP and the S&T Advisor to the Secretary of State, so that they would not be surprised.

I think that it is important to revisit our practices and policies when a departure can provide a valuable public service and wouldn't compromise our other goals and values. Let's think through our goals, the value that achieving them would provide, how we can achieve those goals, and whether the actions needed are compatible with our principles.

Thanks.

Micah
